

## Command 039, ControlAction

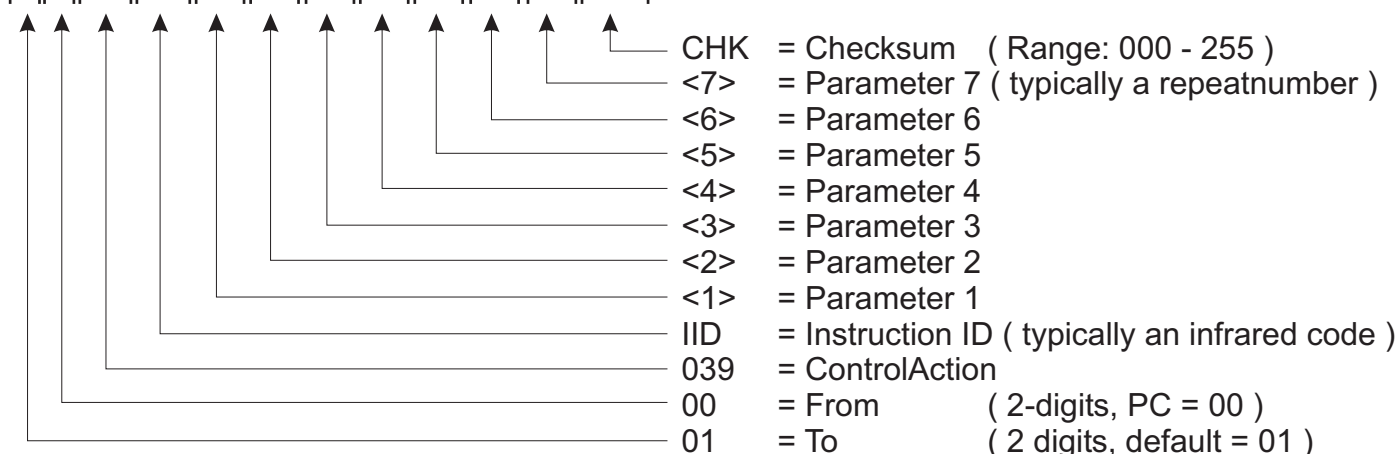

See Appendix C

Command 039 instructs the LinTronic product (for example TT455-RT-238) to send InfraRed signals, control digital outputs, flash the front led, etc.

Command 039 requires some parameters, depending what is supposed to be carried out. Typically the parameters are an instruction ID and 7 pcs 3-digit numbers.

0100039 IID <1><2><3><4><5><6><7>CHK

Most Instruction ID's (IID) simply indicate the type of infrared signal to be transmitted:

- 701 = Bang&Olufsen infrared codes or digital signals
- 705 = Philips RC5 infrared codes (and variants)
- 713 = NEC infrared codes

Some codeset parameters can be manipulated to change the behaviour of the code. For example to determine whether the code is to be send as IR or on the digital output. Some of the products we support by RS232 offer a wide range of possibilities and special instruction is required.

To see Command 039 in action, test an infrared code in CommandList.  
See next page.
